Above and Beyond

Backend Features

For our project, we added several new features to enhance the player experience. These improvements include:

- **Room System**
 - Players can create, cancel, or "quick join" a room.
 - Players can join a specific room by typing its room ID.
 - Players can see how many users are currently online on the server.
 - Players can refresh to get the latest room list.
- **Play with BOT**
 - Players can practice against a computer opponent multiple times without affecting their account stats.
 - The server handles human vs human and human vs bot matches separately.

- **Account System**

- Players can create an account to store their game data, including games played, wins, losses, draws, and score.
- Players can register, log in, log out, and switch accounts without restarting the app.
- Players can delete their accounts if they wish.
- Player statistics (games played, wins, losses, draws, and score) are saved persistently in a server-side text file, and the server automatically loads them when restarted. This keeps player data safe even if the server or client closes.
- Players can view their personal account data (score, matches played, wins, losses, draws).

- **Leaderboard System**

- Players can view the leaderboard showing the top players based on their scores.
- Players can see their own rank compared to other players.

- **Game System**

- Players can chat with each other during the game.
- If a player quits or disconnects during a match, it will count as a loss

Frontend Features

- **Balatro-Inspired Theme**

- We used color styles based on the game Balatro to make the app look more colorful and attractive.
- We added a Balatro-themed background and matched the colors of the buttons and menus.

- **Clean UI Layout**

- Styles are written clearly with each style property on a separate line for easier editing.
- Custom fonts, colors, and backgrounds were chosen to match the theme and make the app easier to use.

- **Dynamic Design**

- Room names and player counts are shown with good spacing to make them easier to read.
- When a player hovers over a column they want to play, the border color changes to match the color of their turn.
- This makes it easier for players to see where they are going to drop their piece.

- **Better Text Display**

- Important text areas (like chat and status fields) use bigger fonts for better readability.
- Text alignment was improved so that room names and player counts look clean and organized.
